Rabid Raccoon in Excel community prompts heightened rabies warning

FOR IMMEDIATE RELEASE

CONTACT:

Kendall Bush
251-275-4177

Local public health officials are urging people to take basic, but extremely important, precautions in the Excel area against rabies. The warning follows the confirmation of a positive raccoon on October 12, 2016. The biggest concern is that a rabid animal may come into contact with humans, their pets or livestock.

The following precautions should be taken to avoid possible exposure to rabies:

- Do not allow pets to run loose; confine them within a fenced-in area or with a leash.
- Do not leave out uneaten pet food or scraps around your house.
- Do not illegally feed or keep wildlife as pets.
- Do not go near domestic animals that are acting in a strange or unusual manner.
- Instruct children not to go near any stray or wild animal regardless of its behavior.
- Advise children to tell an adult if they are bitten or scratched by an animal.

A person who is bitten or scratched by an animal should wash wounds immediately with mild soap and water, apply first aid, and seek medical attention or contact the county health department immediately. Rabies is preventable in humans following exposure provided that treatment is provided in a timely manner.

Avoiding direct contact with wildlife is the primary protection from rabies. In addition, vaccinating animals also reduces the risk of exposure to rabies. Rabies vaccination in animals helps protect people and other pets as well. Alabama state law requires that all dogs, cats and ferrets 12 weeks of age and older must be kept current with rabies vaccination. Rabies vaccines are also available for horses and other livestock if recommended by a veterinarian.
